

Proxy Tickets

Proxy Tickets

ECAS implements a Proxy Credentials system to allow an application (the Proxy) to impersonate users and invoke a backend service protected by ECAS (the Target).

If you need to implement either a Proxy or a Target application, please start by reading the [ECAS Proxy](#) documentation to get acquainted with the protocol. We also have a [powerpoint presentation](#) which can help you catch the concept.

The ECAS team provides two clients with Proxy functionality built-in: one for Weblogic and one for Coldfusion.

1. For more information on the Weblogic client setup, refer to the [ECAS Client Proxy Guide](#).
2. For more information on the Coldfusion client setup, refer to the [ECAS for Coldfusion](#) client guide.

If you specifically need to interface a java web application under Weblogic with a JAX-WS Webservice using proxy credentials, please refer to [ECAS Webservices](#) documentation.

User Experience Feedback

- DG CONNECT (INFSO) has made a nice tutorial about their experience with Proxy Tickets. You can find it on their wiki: [ECAS and PGT](#) .
- The HRS team provides a nice tutorial about the web service for JOB accounts: [HRS JOBS WITH ECAS](#) which is also featured on [HRS Job account ECAS integration](#) which is part of the [HRS Integration Guide](#).

See also the Script Client and Certificate Login Web Service

The ScriptClient uses a Web Service to obtain ServiceTickets (ST), which can be consumed by applications accepting the [CLIENT_CERT](#) strength.

These tickets are useful in case of monitoring or for batch, job or script applications.

See the ScriptClient issue:  [ECAS-911](#) - Problem authenticating. Please check your username and password and try again.

Information about the Certificate Login Web Service URLs:
