

Steps for Building to Production(MasterOneVersion(PROD) or MasterDataLakes(TRANSPORT))

Preliminary Steps

Before starting any actions, visit [EEA ReportNet3 Pull Requests](#) and create a new pull request:

1. Click the **New pull request** button.
2. Select **MasterOneVersion** as the base and **SandboxEnv** as the compare branch.
 - This allows you to review the changes made and verify they align with the current sprint.
 - Ensure that only tickets from the current sprint are included to avoid merging unintended changes.

Subsequent Steps

Step 1: Merge **SandboxEnv** into **MasterOneVersion**

- If there are no conflicts, proceed to the next step and do the merge.

Step 2: Update Parent POM XML Services Version

1. Check the latest version in the Git history:
 - In IntelliJ, navigate to the **parent POM**, right-click, and select **Git -> Show History**.
 - Identify the latest backup version (e.g., v3.2.14).
2. Update the version to the next incremental backup version (e.g., change v3.2.14 to v3.2.15).
3. Commit and push the changes.

Step 3: Build the Image in Jenkins

1. Go to Jenkins and trigger the build to create the image.

Step 4: Update POM XML for Production

1. Change the POM XML version again, this time to the production version (e.g., v3.2).
2. Build the image again in Jenkins.

This process ensures:

- The main production build is versioned as v3.2.
 - A backup version (v3.2.15) is available for fallback purposes.
-

Building for Different Environments

Sandbox

- Cut from MasterOneVersion(**PROD**) and create a new branch
- Do your changes In your branch
- Merge your branch to **SandBoxEnv(SANDBOX)**.
- Follow the “**Steps for Building to Production**” by merging **SandboxEnv** to **MasterOneVersion(PROD)**

Test

- Cut from MasterOneVersion (**PROD**) and create a new branch
- Do your changes In your branch
- Merge your branch to **TestEnv(TEST)**.
- Follow the “**Steps for Building to Production**” by merging **TestEnv** to **MasterOneVersion (PROD)**

Development (Dev)

- Cut from **MasterDataLakes (TRANSPORT)** and create a new branch
- Do your changes In your branch
- Merge your branch to **DevEnv(DEV)**.
- follow the “**Steps for Building to Production**” by merging **DevEnv** to **MasterDataLakes (TRANSPORT)**
